

LEEMICK Ltd

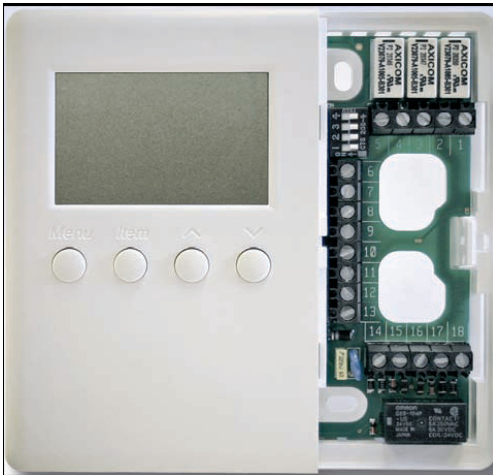

We offer control systems that are designed for each application whether it's a small extension or a large commercial project.

Each system will have the user requirements taken fully into account.

We can control systems using multiple zones, multiple times and multiple temperatures.

To do this we have looked at the controls market and selected product that will work as one.

We can extend existing systems to enable underfloor heating to become part of that system or we can design a replacement.

We offer product that suits users and designers alike with modern design and colour. (We can supply thermostats in 12 colours from White, Blue, Red even Metallic Bronze and Platinum. We also offer Radio operated equipment for Refurbishment projects.

LEEMICK Ltd

Underfloor Heating

**We aim to design,
supply and install
an invisible
heating system,
that will replace
only the heat that
is lost, at the speed
it is lost, without
fuss, and in a cost
effective and
energy efficient
manner.**

The Natural Choice

Heat rises. The logic is as impeccable as the physics, so - as the Romans discovered
- If you are going to increase the temperature in a room, emit heat at the lowest possible point and allow it to rise. It will generate a warm, comforting atmosphere in the process.

LEEMICK Ltd. have taken the age old principle of underfloor heating and given it a 21st century interpretation with advanced insulation materials, long life polyethylene piping to distribute the warm water, state-of-the-art electronic controls, all planned with the latest in CAD technology.

Underfloor heating is the logical choice for the home. It allows total design freedom with no obstructions on the walls or exposed pipe work to detract from the interior decor. For the very young and the elderly, the underfloor heating is the last word in safety with potentially dangerous pipe work either buried in the floor screed or safely beneath the floor covering.

With heat rising from the lowest point in the room, underfloor heating is arguably the most comfortable form of domestic warmth generation, and can offer energy savings over more traditional Systems.

Advice & Design of Underfloor Systems

We offer free advice on all system aspects and using your plans to assess the heat loss, We produce a computerised design of the most efficient system layout.

Integration

We integrate all the services from the heat source into one system that works to supply heat where and when it is required. As a Renewable energy partner of Danfoss Heat Pumps, we can offer all five heat pump principles to enable the best and most economic use of renewable energy with the back up of one of the largest heat pump manufacturers in Europe.

Control Systems

We offer Control systems to meet any specification, From a fixed temperature Blending Valve to a fully integrated system controlling multiple zones and multiple heat emitting devices, such as Radiators, Hot Water Services, Spar's, Towel Rails and Swimming pools.

Service

We service and maintain all different types of water based underfloor heating and offer tailored maintenance to suit your requirements.

Fault finding

We will fault find on any water based underfloor heating system and offer practical advice on the best solutions available to get your system up and running

We Help

We offer on site advice on all aspects of Underfloor heating, Control systems and will offer technical advice regarding the system design and installation of Danfoss heat pumps.
